Homework 6

Heroku App Link: https://frozen-badlands-72286.herokuapp.com/

The following static HTML pages were created for this project using Bootstrap libraries and modifying sample templates:

appointments.html

This page is accessible via two ways: (1) access it from the heroku deployed app by using this url: https://frozen-badlands-72286.herokuapp.com/html/appointments.html, or (2) perform a GET appointments request by heading to this endpoint: /users/monica/appointments. *I commented out the previous code that was executed through this endpoint since it interfered with the work response.sendFile() was doing.*

This page is a sample look and feel for the form that will be used to create appointments within the utuezi app. It displays a number of fields grouped in a list and styled with bootstrap css style sheet "form-group".

login.html

This page is accessible via two ways: (1) access it from the heroku deployed app by using this url: https://frozen-badlands-72286.herokuapp.com/html/login.html, or (2) perform a GET users request by heading to this endpoint: /users. *I commented out the previous code that was executed through this endpoint since it interfered with the work response.sendFile() was doing.*

This page is a sample look and feel for the form that will be used to sign in within the utuezi app. It displays a sign-up section for those who do not have an utuezi account registered. It also displays a sign in section for those who do. Style comes from modified bootstrap "jumbotron" css stylesheet.

home.html

This page is accessible via two ways: (1) access it from the heroku deployed app by using this url: https://frozen-badlands-72286.herokuapp.com/html/home.html, or (2) perform a GET root node request

by heading to this endpoint: /. *I commented out the previous code that was executed through this endpoint since it interfered with the work response.sendFile() was doing.*

This page is a sample look and feel for the home page that will be used to welcome users to the utuezi app. It displays a simple welcome message and also sports buttons to move to the previously mentioned html pages (however, this functionality is still not implemented. Buttons will not respond). Style comes from modified bootstrap "starter-template" css stylesheet.
